

THE SOLUTION

Autonomous 7-Stage Triage Pipeline

1

Universal Normaliser
Ingests SBOMs, Dockerfiles, requirements.txt, pom.xml, free-form emails, or GitHub/docs URLs into canonical package purls.

2

Multi-Source Prober
Version-aware live queries: Docker Hub, Quay.io, RHEL/EPEL, PyPI, Maven, IBM Open-CE — with clickable evidence URLs.

3

Build Dependency Scoper
Recursively extracts BuildRequires for every unported package and checks each transitive dep for ppc64le availability.

4

Architecture Auditor
Flags x86 SIMD (AVX2/AVX-512), inline assembly, and 4KB-page allocators. Generates SIMD/VeX remediation code.

5

CI Posture Scanner
Detects upstream ppc64le CI markers and Power repc down.

6

3-Pillar Sizing Engine
Build + Engineering + Test effort with calibrated SIMD Fibonacci ceiling.

7

LLM Executive Synthesis
Gemini 2.5 Flash generates a tailored customer memo offline.
